

I am strong favor of RM-10352. I enjoy participating in multi-modes on the 160 meter band and think it would be beneficial to my communication. I like to use some of the newer digital modes that use narrow bandwidth but have been stomped on by the broader ones such as side band QSOs. I would like to see the 160 meter band become similar to the other band in that there is a defined segment of the band to be used for digital communications. I think having a specified dedicated portion will be condusive to better exchanges and the elimination of disreputed QSOs due to bleedovers or total blanking out. I think this segmentation will encourage the use and experimentation with the newer and future digital modes being developed.
